## Linear Fog Equation

### Equation One (1)

$$\text{Attenuation Factor}(f) = \frac{\text{Maximum Distance} - \text{Pixel Distance}}{\text{Maximum Distance} - \text{Minimum Distance}}$$

### Equation Two (2)

$$\text{Color} = f \cdot \text{Object Color} + (1-f) \cdot \text{Fog Color}$$

### Equation Three (3)

$$\text{Color} = \frac{\text{Pixel Distance} - \text{Minimum Distance}}{\text{Maximum Distance} - \text{Minimum Distance}} \cdot \text{Fog Scale}$$

## Render Scene Based on Fog Factor

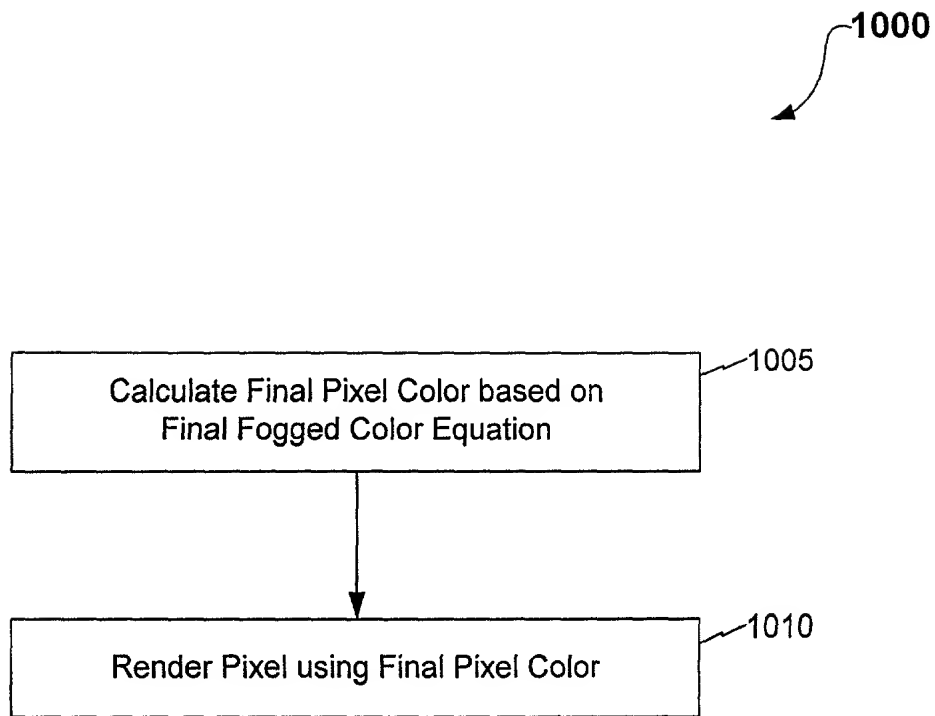

FIG. 10

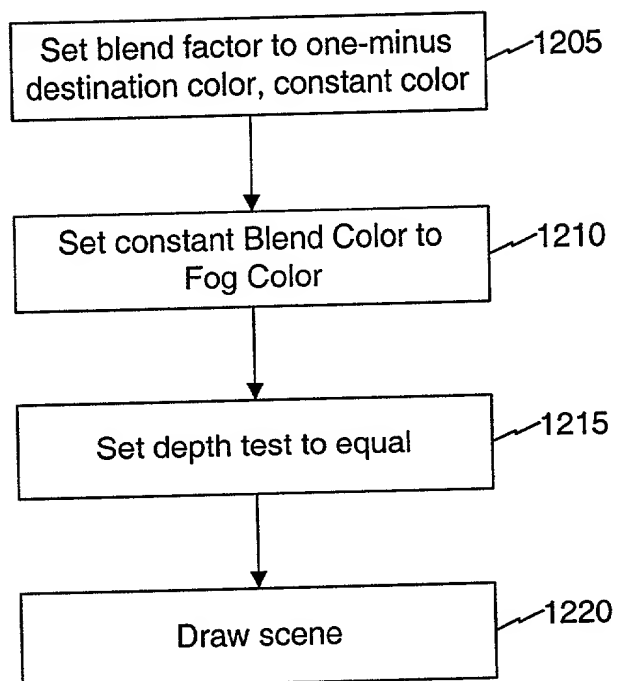

## Final Fogged Color Equation

Unfogged pixel color • fog factor + fog color • (1 - fog factor)

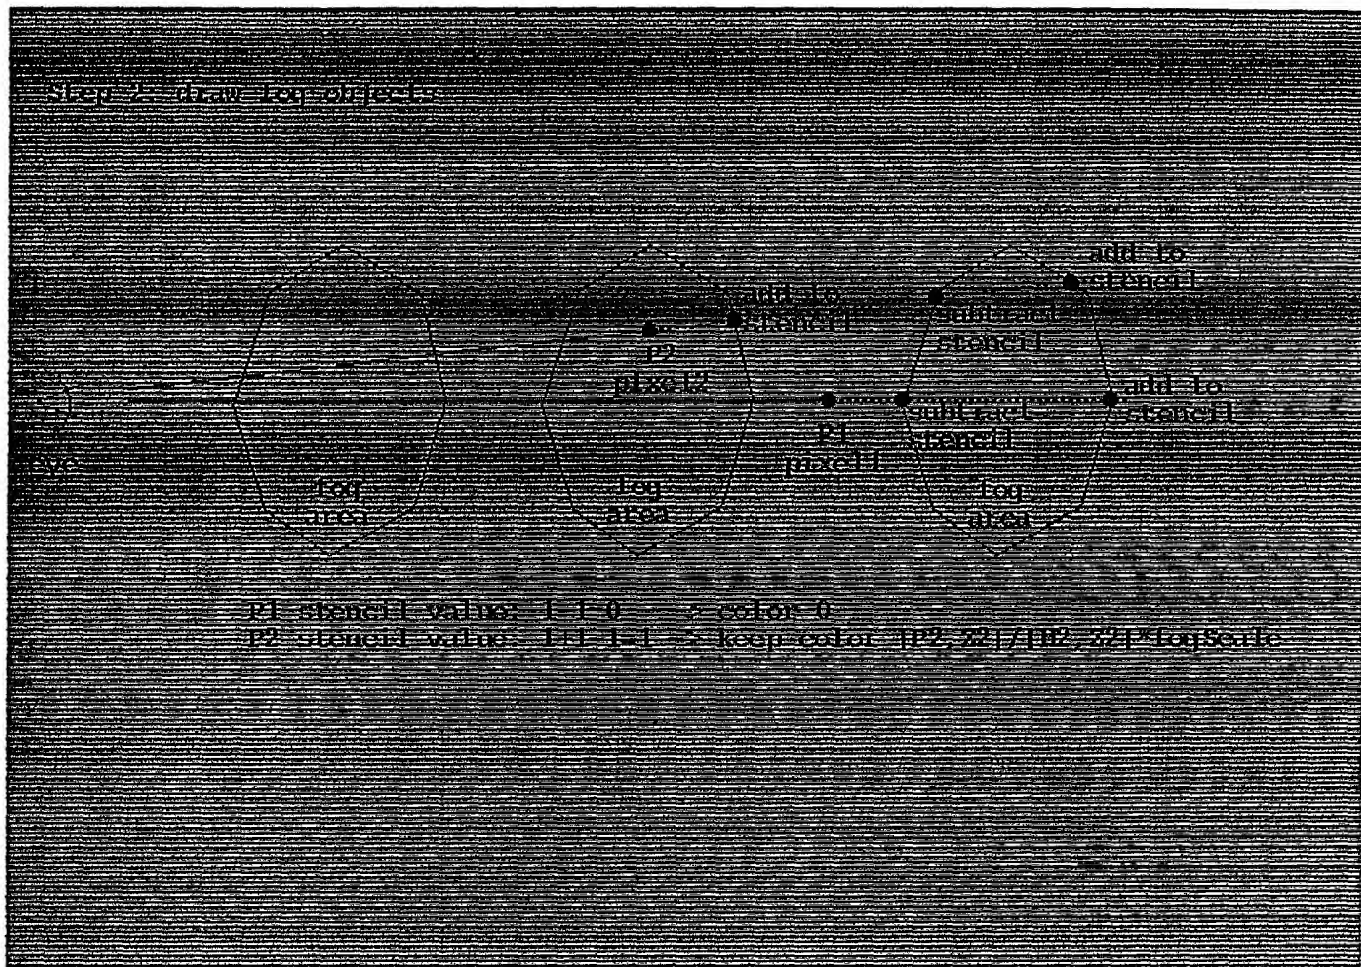

FIG. 13C

Diagram illustrating the drawing of fog objects in a 3D scene. The scene shows three overlapping fog volumes (fog areas) and a camera (eye). The diagram labels various points (P1, P2, P3, P4, M1, M2, Z1, Z2) and distances (eye distance point, max distance). Below the diagram, the code for drawing the fog objects is provided, showing the calculation of pixel colors for two fog volumes (P1 and P2) based on their distance from the camera and the fog scale.

```

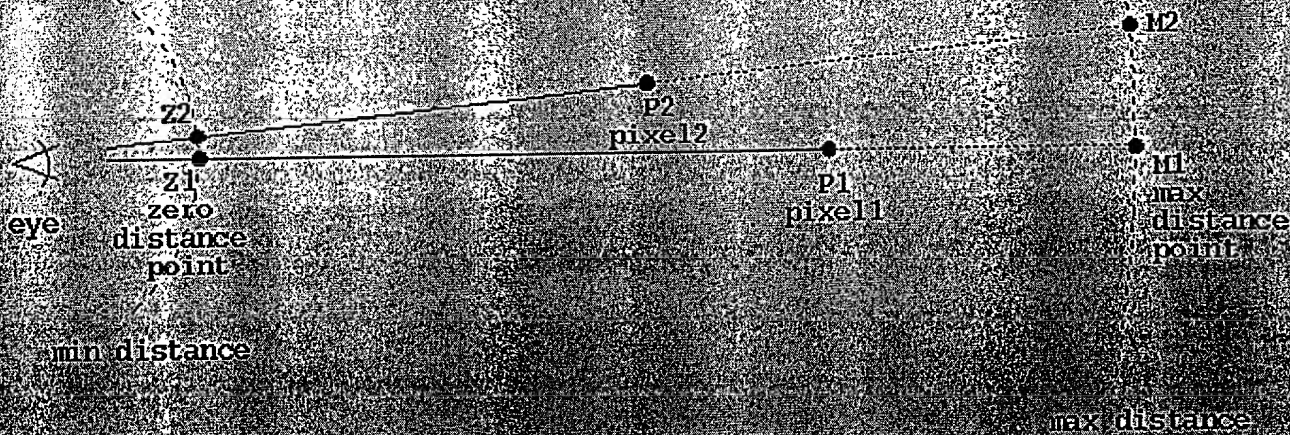

P1 color:
0
((P3, Z1)/(P1, Z1)*fogScale)
((P2, Z1)/(M1, Z1)*fogScale)
((P4, Z1)/(M1, Z1)*fogScale)
((P2, Z1)/(P1, Z1)*fogScale)
((P2, M2) * ((P4, M1)/(P1, Z1)*fogScale)

P2 color:
((P2, Z2)/(P2, Z2)*fogScale)
((M1, Z2)/(P2, Z2)*fogScale)
((P3, Z2)/(P2, Z2)*fogScale)
((P1, Z2)/(P2, Z2)*fogScale)
((P1, M1) * ((P3, P2)/(P2, Z2)*fogScale)

```

**FIG. 13D**

# Step 4: convert pixel values

$P1\_color = P1\_color * fogDensity / fogScale * |M1, Z1|$   
 $P2\_color = P2\_color * fogDensity / fogScale * |M2, Z2|$     note  $|M1, Z1| = |M2, Z2|$   
 (linear fog)

or

$P1\_color = pixelmap[P1\_color / fogScale * |M1, Z1|]$   
 $P2\_color = pixelmap[P2\_color / fogScale * |M2, Z2|]$   
 (exp or exp2 fog)
